3-Substituted 1-Arylindole Compounds

Field of the Invention

The present invention relates to novel 3-substituted 1-arylindole compounds and their acid addition salts, to methods for preparing such compounds, pharmaceutical compositions comprising the compounds as an active ingredient and to their use. The novel compounds show central antiserotonergic activity and possibly also antidopaminergic activity and are, accordingly, useful in the treatment of central nervous system (CNS) disorders.

10

Background of the Invention

It is well known that serotonin (5-HT) receptor antagonists, in particular 5-HT₂ receptor antagonists, are useful in the treatment of CNS disorders. So, 5-HT₂ receptor antagonists have been reported to show effects in the treatment of anxiety, aggression, depression, sleep disturbances, migraine, negative symptoms of schizophrenia, extrapyramidal side effects induced by conventional antipsychotics, abuse of drugs and substances of abuse and Parkinson's disease. For example reference may be made to the following:

20 The selective 5-HT₂ receptor antagonist ritanserin has been shown to be an antidepressant and to improve depressive symptoms of schizophrenia (E. Klierer, W. H. Strauss; Pharmacopsychiat. 21 (1988), pp. 391–393) and it has been demonstrated to exert effects in an animal test indicative of anxiolytic drug activity (F.C. Colpart et al.; Psychopharmacology (1985) 86; 303–305). Furthermore, ritanserin has been shown to improve the quality of sleep (P. A. J. Janssen; Pharmacopsychiat. 21 (1988), 33–37).

It is generally believed that 5-HT is involved in migraine attacks. The links between 5-HT and migraine attacks are several and they suggest a number of mechanisms whereby 5-HT may be involved (Scrip Report; "Migraine – Current trends in research and treatment"; PJB Publications Ltd.; May 1991).

30

Studies of the mixed serotonin and dopamine receptor antagonist setoperone indi-

cate that blockade of 5-HT₂ receptors may be related to improvement of negative symptoms of schizophrenia (Ceulemans et al., Psychopharmacology (1985) 85, 329-332).

5 Finally, ritanserin has been found to relieve neuroleptic-induced parkinsonism (Bersani et al.; Clinical Neuropharmacology, 13, No. 6 (1990), 500-506) and to reduce abuse of alcohol and drugs (Meert et al., Pharmacopsychiatry, 24 (5), 1991, 159-163).

10 Damping of dopamine (DA) overactivity by the use of DA receptor blocking drugs is today the most important principle in the treatment of schizophrenia, in particular the positive symptoms thereof. "Classical neuroleptics" such as haloperidol, cis-(Z)-flupentixol and chlorpromazine are believed to induce antipsychotic effect via DA receptor blockade.

In method (a) the alkylation is performed at 20-120 °C in an aprotic solvent such as acetone or isobutyl methyl ketone in the presence of free base (e.g. K_2CO_3 or triethylamine). The starting material II is prepared from the corresponding alcohol, which is prepared as described below, either by reaction with mesylchloride or tosylchloride or by reaction with thionylchloride or phosphorus oxychloride at conditions obvious to the chemist skilled in the art. The amines used as reactants are either commercially available or prepared by reaction of 1-(2-chloroethyl)-2-imidazolidinone or 1-(2-chloroethyl)-3-(2-propyl)-2-imidazolidinone with excess of appropriate amines at standard conditions.

The 3-(1-aryl-3-1*H*-indolyl)propanols used as starting material for the preparation of II are prepared as follows (EXAMPLE 1). Ullmann arylation of substituted 3-(3-1*H*-indolyl)propanoic acids (prepared according to the methods described in GB Patent No. 1,220,628, *Chem. Abstr.* **1971**, 75, 5690h, Renson, *Bull. Soc. Chim. Belg.* **1959**, 68, 258-269 and Salituro *et al.*, *J. Med. Chem.* **1990**, 33, 2944-2946) with properly substituted aryl iodides in NMP, DMF, HMPA or DMSO with potassium carbonate as base and catalyzed by copper, copper(I) iodide or copper(I) bromide at 150-200 °C results in substituted 3-(1-aryl-3-1*H*-indolyl)propanoic acids. The acids thus obtained are reduced to substituted 3-(1-aryl-3-1*H*-indolyl)propanols by lithium aluminum hydride reduction at standard conditions.

The substituted 2-(1-aryl-3-1*H*-indolyloxy)ethanols used as starting materials for the preparation of II are prepared as follows (EXAMPLE 2). Alkylation of substituted methyl 1-aryl-3-hydroxy-1*H*-indol-2-carboxylates (prepared from properly substituted *N*-(*o*-carboxyaryl)glycine according to methods described in Unangst *et al.*, *J. Heterocyclic Chem.* **1984**, 21, 709-714 and *J. Heterocyclic Chem.* **1987**, 24, 811-815) with methyl bromoacetate results in corresponding methyl 2-(2-methoxycarbonyl-1-aryl-3-1*H*-indolyloxy)acetates, according to literature methods in Unangst *et al.*, *J. Heterocyclic Chem.* **1984**, 21, 709-714. These diesters are hydrolyzed and subsequently decarboxylated to give corresponding 2-(1-aryl-3-1*H*-

indolyloxy)acetic acids by methods obvious to the chemist skilled in the art. The acids thus obtained are reduced to substituted 2-(1-aryl)-3-1H-indolyloxy]ethanols by lithium aluminum hydride reduction at standard conditions.

- 5 The 2-(3-1H-indolylthio)ethanols used as starting materials for the preparation of II are prepared as follows. 2,3-Dihydro-1-aryl-3-1H-indolones are reacted with 2-mercaptoacetic acid by heating of the reactants at reflux in toluene using a Dean-Stark apparatus with *p*-toluenesulfonic acid as a catalyst. (EXAMPLE 10). The acids thus formed are subsequently reduced to the corresponding alcohols by lithium alumi-
- 10 nium hydride reduction at standard conditions. The substituted 2,3-dihydro-1-aryl-3-1H-indolones used as starting materials are prepared by deprotection of substituted 3-acetoxy-1-arylindoles (prepared according to methods in Perregaard *et al.*, *J. Med. Chem.* **1992**, *35*, 1092-1101) by heating in an aqueous solution of sodium sulfite (EXAMPLE 4), according to the procedure described in Nenitzescu *et al.*,
- 15 *Chem. Ber.* **1958**, *91*, 1141-1145.

In method (b) the reductions of III are performed by using LiAlH₄, AlH₃, B₂H₆ or a BH₃ complex in an inert solvent as e.g. diethyl ether or tetrahydrofuran at 0 °C to 70 °C. The starting material III is prepared as described below.

20

- The carbamate protected or acylated compounds of Formula III in which R⁸ is as defined above or is a hydrogen atom are prepared by reaction of a substituted 2,3-dihydro-1-aryl-3-1H-indolone with a properly substituted amino alcohol by heating the reactants at reflux in toluene using a Dean-Stark apparatus and *p*-toluenesulf-
- 25 onic acid as a catalyst (EXAMPLE 5). Compounds of Formula III in which R⁸ is a hydrogen atom are converted to compounds of Formula III in which R⁸ is as defined above by reducing the acyl or carbamate group to an alkyl group and subsequently introduce appropriate carbamate or acyl groups by conventional methods. The substituted 2,3-dihydro-1-aryl-3-1H-indolones used as starting materials are
- 30 prepared as described above. The substituted aminoalcohols used as reactants are prepared according to literature procedures for corresponding compounds. The carbamate protected or acylated β-amino alcohols containing a chiral center are prepared from corresponding chiral α-amino acids according to a one-pot procedure

described by Correa *et al.*, *Synth. Comm.* **1991**, *21*, 1-9. 2,2-Dimethyl-2-aminoethanol is commercially available and was carbamate protected by standard procedures.

The alkylation in method (c) is performed at 20-120 °C in an aprotic solvent such as acetone or isobutyl methyl ketone in the presence of a base (e.g. K₂CO₃ or triethylamine) and the starting material IV is prepared as described below.

The secondary amine IV is prepared by hydrolysis of a compound of Formula III using standard conditions for deprotection of carbamates or hydrolysis of tertiary amides obvious to the chemist skilled in the art or by reduction of compounds of Formula III in which R⁸ is a hydrogen atom by conventional methods.

In methods (d) and (e) the reductions of V and VI are performed by using LiAlH₄, AlH₃, B₂H₆ or a BH₃ complex in inert solvents as e.g. diethyl ether or tetrahydrofuran at 0 °C to 70 °C. The starting material is prepared by alkylation of substituted methyl 1-aryl-3-hydroxy-1H-indol-2-carboxylates, prepared as described above, with *N,N*-dimethyl-2-chloroacetamide according to the method described by Unangst *et al.*, *J. Heterocyclic Chem.* **1987**, *24*, 811-815. The starting material for method (e) is prepared by reaction of compound IV with an alkyl or aryl sulfonylchloride in an aprotic solvent such as e.g. dichloromethane at -30 °C to 0 °C.

Aminoalkyl derivatives of the Formula VII used in method (f) are prepared by alkylating a compound of the Formula IV with a halo-nitrile of the following formula: hal(CH₂)_{n-1}CN in the presence of a base (e.g. K₂CO₃ or triethylamine) in an inert solvent such as acetone, MIBK or toluene at elevated temperature (30-100 °C). The cyano group may be reduced according to standard procedures using e.g. AlH₃, LiAlH₄ or B₂H₆. The R¹¹ substituent is introduced by direct alkylation or by an acylation/reduction procedure, which is obvious to the chemist skilled in the art. Acylation of the thus obtained amino derivatives is accomplished by addition of an acylating agent at a low temperature (-20 to 30 °C) preferably in a chlorinated solvent (dichloromethane, chloroform, or 1,1,1-trichloroethane) and, if necessary, in the presence of a base to neutralize any acidic reaction product formed.

In method g) the Ullman arylation is conveniently performed as described above for the arylation of 3-(3-1*H*-indolyl)propanoic acid (EXAMPLE 13). The starting material VIII in which X is a methylene group is prepared by acylation of the corresponding 1,3-unsubstituted indole with oxalyl chloride which subsequently is reacted with
5 appropriate amines HNR^8R^9 . The glyoxamide formed is reduced to the corresponding tryptamine by treatment with lithium aluminum hydride according to literature methods (EXAMPLE 14) (Welstad *et al.* J. Med. Chem. 1967, 10, 1015- 1021).

In method h) the Rosenmund-von Braun reaction is performed with copper cyanide
10 in NMP, DMF or MSO at 150-200 °C (EXAMPLE 16). The starting material IX is prepared according to methods a)-g) and i).

In method i) the reductive amination is preferably performed in an one pot procedure using NaCNBH_3 and molecular sieves in an alcohol such as methanol, Borch
15 *et al.* J. Am. Chem. Soc. 1971, 93, 2897-2904 (EXAMPLE 12). Alternatively, the reaction can be performed in a two step procedure. In the first step the intermediate imine is formed by reaction of indole derivative, X, with an amine, HNR^8R^9 , by methods obvious to the chemist skilled in the art. The intermediate imine is reduced with a reducing agent such as NaBH_4 , NaCNBH_3 or LiAlH_4 in an appropriate
20 solvent. The starting material of Formula X is prepared by Vilsmeier formylation of a corresponding 3-unsubstituted indole using standard conditions (EXAMPLE 11).

The 1-(2-chloroethyl)-2-imidazolidinone and 1-(2-chloroethyl)-3-(2-propyl)-2-imidazolidinone used as reactants above are prepared according to literature procedures in
25 Johnston *et al.*, J. Med. Chem. 1963, 6, 669-681, Perregaard *et al.*, J. Med. Chem. 1992, 35, 1092-1101 and DE-A1 2035370, 1971., Chem. Abstr. 1971, 74, 87985z.

The acid addition salts of the compounds of the invention are easily prepared by methods well known in the art. The base is reacted with either the calculated
30 amount of organic or inorganic acid in an aqueous miscible solvent, such as acetone or ethanol, with isolation of the salt by concentration and cooling, or reacted with an excess of the acid in an aqueous immiscible solvent such as ethyl ether or chloroform, with the desired salt separating directly. These salts may also

be prepared by the classical method of double decomposition of appropriate salts.

The compounds of general Formula I and the pharmaceutically acceptable acid addition salts thereof may be administered in any suitable way, e.g. orally or parent-
5 erally, and the compounds may be presented in any suitable form for such administration, e.g. in the form of tablets, capsules, powders, syrups or solutions or dispersions for injection.

An effective daily dose of the a compound of general Formula I or a pharmaceuti-
10 cally acceptable salt thereof is from 0.05 to 500 mg, preferably 0.5 to 100 mg.

Examples

In the following the invention is further illustrated by way of examples which may in
15 no way be construed as limiting for the invention.

^1H NMR spectra were recorded at 250 MHz on a Bruker AC 250 spectrometer. Deuterated chloroform (99.8% D) or dimethylsulfoxide (99.9% D) were used as solvents. TMS was used as internal reference standard. Chemical shift values are
20 expressed in ppm-values. The following abbreviations are used for multiplicity of NMR signals: s=singlet, d=doublet, t=triplet, q=quartet, qui=quintet, sex=sextet, h=heptet, dd=double doublet, m=multiplet. Content of water in crystalline compounds was determined by Karl Fischer titration. Results obtained by microanalyses were within $\pm 0.4\%$ of the theoretical values.

25

Mass spectra were obtained on a Quattro MS-MS system from VG Biotech, Fisons Instruments, Manchester, GB. The MS-MS system was connected to an HP 1050 modular HPLC system. A volume of 20 - 50 μl of the sample (0.1 - 0.05 mg/ml) dissolved in a mixture of acetonitrile:water:acetic acid = 250:250:1 (v/v/v) was
30 introduced via the autosampler at a flow of 30 $\mu\text{l}/\text{min}$ into the Electrospray Source. Spectra were obtained at two sets of standard operating conditions. One to obtain molecular weight information (MH^+) and another to obtain fragmentation in the source (high cone voltage). The background was subtracted. The relative intensities

of the molecular ions obtained in the fragmentation spectrum are given. If the relative intensity of the MH^+ ion not is given this ion was only obtained in the molecular weight spectra.

5 EXAMPLE 1

3-[5-Chloro-1-(4-fluorophenyl)-3-1*H*-indolyl]propanol (1a)

A mixture of 3-(5-chloro-3-1*H*-indolyl)propanoic acid (17.5 g, 0.078 mol), 4-fluoroiodobenzene (20.8 g, 0.094 mol), CuI (2.4 g), K_2CO_3 (21.6 g, 0.16 mol) and *N*-methyl-2-pyrrolidone (0.20 L) was heated at 165 °C for 7 h. The reaction mixture
10 was cooled to room temperature and water (0.25 L) was added. After acidification with concentrated hydrochloric acid, the mixture was extracted with diethyl ether (2 X 0.30 L). The combined organic phases were washed with brine (3 X 0.40 L) and dried (Na_2SO_4). Evaporation of the solvents afforded crude 3-[5-chloro-1-(4-fluorophenyl)-3-1*H*-indolyl]propanoic acid (26 g) as an oil. The oil was dissolved in dry
15 diethyl ether and added to a suspension of lithium aluminum hydride (15 g, 0.40 mol) in dry diethyl ether (0.20 L) over 30 min. After reflux for further 2 h the reaction mixture was cooled to 0 °C and carefully treated with water (15 ml), 4 N aqueous NaOH (15 ml) and then water (75 mL). The resulting mixture was filtered and dried (Na_2SO_4). Evaporation of the solvents afforded the title compound (1a) as an oil
20 (17.6 g, 74 %). An analytical sample was crystallized from heptane: mp. 67-69 °C; 1H NMR ($CDCl_3$) δ 1.55 (broad s, 1 H), 2.00 (qui, 2 H), 2.90 (t, 2 H), 3.75 (t, 2 H), 7.10 (s, 1 H), 7.15 (broad d, 1 H), 7.20 (t, 2 H), 7.35 (d, 1 H), 7.40 (dd, 2 H), 7.60 (broad s, 1 H). Anal. ($C_{17}H_{15}ClFNO$) C, H, N.

25 EXAMPLE 2

2-[5-Chloro-1-(4-fluorophenyl)-3-1*H*-indolyloxy]ethanol (2a)

A mixture of methyl 5-chloro-1-(4-fluorophenyl)-3-hydroxy-1*H*-indol-2-carboxylate (200 g, 0.62 mol), methyl 2-bromoacetate (125 g, 0.81 mol), K_2CO_3 (112 g, 0.81
30 mol) and acetone (2.0 L) was refluxed for 18 h. The mixture was cooled to room temperature and filtered, and the solvents were evaporated *in vacuo*. To the remaining oil (270 g) methanol (1.5 L) and 3 N aqueous KOH (0.6 L) was added. After reflux for 1 h, the solution was cooled to room temperature and acidified by

concentrated hydrochloric acid. The product thus precipitated was filtered off and dissolved in ethyl acetate and dried (Na₂SO₄). Evaporation of the solvents afforded 2-[2-carboxy-5-chloro-1-(4-fluorophenyl)-3-1*H*-indolyloxy]acetic acid (240 g) as an oil which was decarboxylated without further purification. A mixture of the crude
5 dicarboxylic acid, copper (15 g) and *N*-methyl-2-pyrrolidone was refluxed for 1.5 h. The mixture was cooled to room temperature and water (2.0 L) was added. The product thus precipitated was filtered off and dissolved in ethyl acetate (1.5 L). The solution was washed with brine (3 X 1 L) and dried (Na₂SO₄). Evaporation of the solvents afforded the crude 2-[5-chloro-1-(4-fluorophenyl)-3-1*H*-indolyloxy]acetic
10 acid (223 g) which was dissolved in dry diethyl ether (1.5 L). The thus formed solution was added to a suspension of lithium aluminum hydride (70 g, 1.9 mol) in dry diethyl ether (1.0 L) over 45 min. After reflux for additional 0.5 h, the reaction mixture was cooled to 0 °C and carefully treated with water (70 ml), 4 N aqueous NaOH and then water (300 mL). The reaction mixture was filtered and dried
15 (Na₂SO₄). Evaporation of the solvents afforded crystalline title compound (110 g, 55 %). An analytical sample was recrystallized from diethyl ether: mp 118-120 °C; ¹H NMR (CDCl₃) δ 2.35 (broad s, 1 H), 4.0 (t, 2 H), 4.15 (t, 2 H), 6.85 (s, 1 H), 7.10 (broad d, 1 H), 7.15 (t, 2 H), 7.40 (dd, 2 H), 7.65 (broad s, 1 H). Anal. (C₁₆H₁₃ClFNO₂) C, H, N.

20 The following compound was prepared in a similar way:

2-[6-Chloro-1-(4-fluorophenyl)-3-1*H*-indolyloxy]ethanol (**2b**): mp 97-98 °C (diethyl ether); ¹H NMR (CDCl₃) δ 4.00 (t, 2 H), 4.15 (t, 2 H), 6.80 (s, 1H), 7.10 (d, 1H), 7.20 (t, 2 H), 7.40 (s, 1 H), 7.35 (dd, 2 H), 7.60 (d, 1 H). Anal. (C₁₆H₁₃ClFNO₂) C, H, N.

25 EXAMPLE 3 (method a)

1-[2-[[2-[5-chloro-1-(4-fluorophenyl)-3-1*H*-indolyloxy]ethyl]methylamino]ethyl]-2-imidazolidinone maleate (**4b**).

To a solution of 2-[5-chloro-1-(4-fluorophenyl)-3-1*H*-indolyloxy]ethanol (**2a**) (4.8, 0.016 mol) and triethylamine (5 mL) in dichloromethane (50 mL), a solution of
30 methanesulfonyl chloride (1.9 mL, 0.025 mol) in dichloromethane (16 mL) was added at 0-5 °C over 0.5 h. After stirring for 3 h at room temperature the reaction mixture was washed with water (2 X 100 mL), dried (Na₂SO₄) and the solvents were evaporated *in vacuo*. Excess of methanesulfonyl chloride was removed by

concentrating the remaining oil with toluene *in vacuo* several times. The crude methanesulfonate of 2a (6.0 g, 0.016 mol) was used without further purification. A mixture of the crude methanesulfonate, 2-(methylamino)ethyl-2-imidazolidinone (4.9 g, 0.034 mol), K₂CO₃ (4.0 g, 0.029 mol) and methyl isobutyl ketone was refluxed for 18 h. After cooling to room temperature water (100 mL) was added and the resulting mixture was extracted with ethyl acetate (2 X 100 mL). To a solution of 5-chloroindole (20 g, 0.13 mol) in dry diethyl ether (200 mL) was added a solution of oxalylchloride (20 g, 0.16 mol) in dry diehtyl ether (200 mL) at 0-5 °C. After stirring for 0.5 h at 0-5 °C was added a solution of benzylmethylamine (24 g, 0.20 mol) in dry diethyl ether at 0-5 °C and triethylamine was slowly added to pH at 8-9. Water and ethyl acetate (500 mL) was added and the organic phase was washed with brine and dried (Na₂SO₄). Evaporation of the solvents afforded the crude *N*-benzyl-*N*-methyl-2-(5-chloro-1-(4-fluorophenyl)-3-1*H*-indolyl)-2-oxoacetamide (19.1 g) as an oil. A solution of the crude *N*-benzyl-*N*-methyl-2-(5-chloro-1-(4-fluorophenyl)-3-1*H*-indolyl)-2-oxoacetamide (20.1 g, 0.058 mol) in dry tetrahydrofuran (200 mL) was added to a suspension of lithium aluminium hydride (5.4 g, 0.14 mol) in tetrahydrofuran (100 mL). After heating at reflux for 2.5 h the reaction mixture was cooled to 0 °C and treated with water (6 mL) and 4 N aqueous NaOH (6 mL). The precipitate was filtered off and extracted with dichloromethane (3 X 200 mL). The combined organic phases were dried (Na₂SO₄) and the solvents were evaporated. The remaining oil was purified by column chromatography (eluted with ethyl acetate) affording *N*-benzyl-*N*-methyl-2-(5-chloro-3-1*H*-indolyl)ethylamine (16 g) as an oil: ¹H NMR (CDCl₃) δ 2.30 (s, 3 H), 2.65-2.80 (m, 2 H), 2.85-3.00 (m, 2 H),

After cooling the mixture was worked up as above leaving 45 g of the crude *N,N*-dimethylacetamide derivative as an visceous oil which was used without further purification. To a solution of *N,N*-dimethyl-1-[5-bromo-1-(4-fluorophenyl)-2-methoxy-
25 carbonylo-1*H*-indol-3-yloxy]acetamide (44 g) in methanol was added an aqueous solution (50 ml) of potassium hydroxide (11 g). After reflux for 2 hours the precipitated potassium salt was filtered off and subsequently dissolved in water. pH was adjusted to <1 by addition of diluted hydrochloric acid. The precipitated carboxylic acid was filtered off, washed with water and finally dried *in vacuo*. Yield : 36 g. Mp :
30 146-150 °C. To a solution of the thus isolated *N,N*-dimethyl-1-[5-bromo-2-carboxy-1-(4-fluorophenyl)-1*H*-indol-3-yloxy]acetamide (10 g) in NMP (100 mL) was added Cu powder (1 g). The mixture was heated at 185-190 °C for 16 hours. After cooling to room temperature precipitates were filtered off and ethyl acetate, water and

The crude product was dissolved in acetone and upon addition of an ether solution of HCl, the hydrochloric salt precipitated. Yield of 16a 2 g. Recrystallisation from 2-propanol gave a pure product with mp 189-190 °C. ^1H NMR ($\text{DMSO}-d_6$) δ 2.85 (s, 6H), 3.55 (t, 2H), 4.45
15 (t, 2H), 7.30 (dd, 1H), 7.35-7.45 (m, 3H), 7.55 (s, 1H), 7.60 (dd, 2H), 7.90 (d, 1H), 10.95 (s, 1H). MS (m/z) 377 (MH^+), 72 (100). Anal. ($\text{C}_{18}\text{H}_{18}\text{BrClFN}_2\cdot\text{HCl}$) C, H, N.
